Mr Paul Cooke
Senior Vice President
4Dx Limited
St Kilda Road
Melbourne Vic 3004
Australia

14 August 2018

Dear Mr Cooke,

Cystic fibrosis (CF) is the most common life threatening inherited condition that Australians face. CF affects many part of the body, particularly the lungs where thick, sticky mucus build up results in repeated chest infections.

Cystic Fibrosis Australia (CFA) is the national CF organisation responsible for advocacy on behalf of the CF community, promoting CF research in order to enhance the well being of the CF community and raising awareness about CF. CFA is always looking for ways to improve the longevity of people with CF and ensure they have the best quality of life.

CFA understands that 4Dx's technology allows lung function to be seen in greater detail than ever before using software to analyse conventional X-ray imaging. Application of this technology to people with CF has the potential to result in earlier diagnosis of lung infections and better monitoring of lung treatment regimes for people with CF. In particular, the 4Dx technology appears to be able to provide detailed maps of lung ventilation so that areas of poor airflow in CF patients can be identified.

CFA looks forward to 4Dx's technology being further developed and commercialized for the benefit of people with CF. To this end, CFA strongly supports the efforts 4Dx is making to obtain additional grants and other resources for this work.

Yours sincerely,
